

Second Preliminary Amendment
Applicants: Ivo Panzani et al.
Serial No.: 10/805,086

Attorney Docket: DID1041USC1

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

1. (previously presented) A method for centrifuging blood in a filling step and controlling a washing step in a blood centrifugation cell wherein blood is introduced into the blood centrifugation cell in the filling step and washing solution is introduced into the blood centrifugation cell in the washing step, the method comprising:

providing a blood centrifugation cell, a pump for communicating liquid to the blood centrifugation cell, and a computer configured to receive data and produce at least one output;

introducing blood into the blood centrifugation cell during the filling step;

centrifuging the blood so the cell contains compacted red blood cells and supernatant at the beginning of the washing step,

providing first input data to the computer indicative of the total volume of liquid that has entered the cell during the filling step that precedes the washing step and during the washing step itself, the liquid being blood during the filling step and the liquid being washing solution during the washing step;

providing second input data to the computer indicative of the hematocrit value of the blood that was introduced during the filling step;

providing third input data to the computer indicative of the geometric characteristics of the cell;

Second Preliminary Amendment
Applicants: Ivo Panzani et al.
Serial No.: 10/805,086

Attorney Docket: DID1041USC1

processing the first, second, and third input data in the computer to produce a first output, said first output being the concentration of the supernatant in the supernatant-washing solution mixture that is present in the cell during the washing step, said first output being produced by the computer executing an algorithm that expresses the supernatant extinction law inside the cell using the first, second, and third input data; and stopping the washing step when a certain concentration of supernatant in the supernatant-washing solution is reached.

2. (original) The method of claim 1, wherein the algorithm has time as a fourth input data.
3. (original) The method of claim 1, wherein the algorithm that expresses the supernatant extinction law inside the cell is derived from a mathematical model.
4. (original) The method of claim 1, wherein the algorithm that expresses the supernatant extinction law inside the cell is derived from an experimental analysis.
5. (original) The method of claim 1, wherein the pump is a peristaltic pump comprising on the drive shaft of the pump a sensor suitable to transmit to the computer said first input data related to the rotation angles of said drive shaft.
6. (original) The method of claim 1, further comprising providing a sensor for measuring the volume of liquid entering the cell and suitable to transmit to the computer said first input data.

Second Preliminary Amendment
Applicants: Ivo Panzani et al.
Serial No.: 10/805,086

Attorney Docket: DID1041USC1

7. (original) The method of claim 1, further comprising providing a sensor for measuring the hematocrit value of the blood entering the cell during the filling step and suitable to transmit to the computer said second input data.

8. (original) The method of claim 1, further comprising providing an operator interface for entering into the computer said second input data indicative of the hematocrit value of the blood.

9. (original) The method of claim 8, wherein said pump comprises an intake and a cardiotomy reservoir is located at the intake for said pump, and wherein said data indicative of the hematocrit value of the blood is determined by measuring a hematocrit value of the blood in the cardiotomy reservoir.

10. (original) The method of claim 1, further comprising providing an operator interface for entering into the computer said third input data indicative of the geometric characteristics of the cell.

11. (original) The method of claim 1, further comprising providing a sensor for automatically detecting the geometric characteristics of the cell and suitable to transmit to the computer said third input data.

12. (original) The method of claim 1, further comprising providing an operator interface for displaying the concentration of the supernatant in the supernatant-washing solution mixture.

Second Preliminary Amendment
Applicants: Ivo Panzani et al.
Serial No.: 10/805,086

Attorney Docket: DID1041USC1

13. (original) The method of claim 12, wherein the operator stops the washing step when a certain concentration of supernatant is reached.

14. (original) The method of claim 1, further comprising providing a controller for stopping the washing step when a certain concentration of supernatant in the supernatant-washing solution is reached.

15. (original) The method of claim 14, wherein the controller stops the washing step when a preset value of the concentration of supernatant in the supernatant-washing solution mixture is reached.

Claims 16 to 20 (canceled).

21 (new). A method for centrifuging blood in a filling step and controlling a washing step in a blood centrifugation cell wherein blood is introduced into the blood centrifugation cell in the filling step and washing solution is introduced into the blood centrifugation cell in the washing step, the method comprising:

providing a blood centrifugation cell, a pump for communicating liquid to the blood centrifugation cell, and a computer configured to receive data and produce at least one output;

introducing blood into the blood centrifugation cell during the filling step;

centrifuging the blood so the cell contains compacted red blood cells and supernatant at the beginning of the washing step;

providing first input data to the computer indicative of the total volume of liquid that has entered the cell during the filling step that precedes the washing step and during the washing step itself, the liquid

Second Preliminary Amendment

Serial No.: 10/805,086

Attorney Docket: DID1041USC1

being blood during the filling step and the liquid being washing solution during the washing step;

providing second input data to the computer indicative of the hematocrit value of the blood that was introduced during the filling step;

providing third input data to the computer indicative of the geometric characteristics of the cell; and

processing the first, second, and third input data in the computer to produce a first output, said first output being the concentration of the supernatant in the supernatant-washing solution mixture that is present in the cell during the washing step, said first output being produced by the computer executing an algorithm that expresses the supernatant extinction law inside the cell using the first, second, and third input data.

22 (new). A method for controlling a washing step in a blood centrifugation cell wherein washing solution is introduced into the blood centrifugation cell in the washing step, the method comprising:

providing a blood centrifugation cell, a pump for communicating liquid to the blood centrifugation cell, and a computer configured to receive data and produce at least one output;

providing first input data to the computer indicative of the total volume of liquid that has entered the cell during the filling step that precedes the washing step and during the washing step itself, the liquid being blood during the filling step and the liquid being washing solution during the washing step;

providing second input data to the computer indicative of the hematocrit value of the blood that was introduced during the filling step;

Second Preliminary Amendment
Applicants: Ivo Panzani et al.
Serial No.: 10/805,086

Attorney Docket: DID1041USC1

providing third input data to the computer indicative of the geometric characteristics of the cell; and
processing the first, second, and third input data in the computer to produce a first output, said first output being the concentration of the supernatant in the supernatant-washing solution mixture that is present in the cell during the washing step, said first output being produced by the computer executing an algorithm that expresses the supernatant extinction law inside the cell using the first, second, and third input data.

REMARKS

Claims 1-15, 21 and 22 are pending. Claim 1 was previously presented. Claims 2-15 are original. Claims 16-20 are cancelled. Claims 21 and 22 are newly presented. Support for claims 21 and 22 can be found in the original disclosure, *inter alia*, at page 6, lines 18-29.

No fees are believed due in connection with this submission. If this is incorrect, please charge any additional fees to Deposit Account No. 16-2312.

Respectfully submitted, c
